

Aura Application Installation Manual

1. Prerequisites

- Linux/macOS terminal (or WSL on Windows)
- Python 3.12+
- pip and virtualenv
- PostgreSQL (optional for local, recommended for production-like setup)
- Git
- Docker (optional for container deployment)

2. Local Installation (Python)

1. Clone repository and move to backend

```
git clone https://github.com/immsamyak/auravtosaas.git
cd auravtosaas/backend
```
2. Create and activate virtual environment

```
python -m venv .venv
source .venv/bin/activate
```
3. Install dependencies

```
pip install -r requirements.txt
```
4. Configure environment variables (recommended)

```
export SECRET_KEY='replace-me'
export DJANGO_DEBUG='True'
export DATABASE_URL='sqlite:///db.sqlite3'
```
5. Run migrations

```
python manage.py migrate
```
6. Create admin user (optional)

```
python manage.py createsuperuser
```
7. Start development server

```
python manage.py runserver
```

3. Optional Integrations

- `REPLICATE\_API\_TOKEN` for real VTO generation
- `STRIPE\_PUBLIC\_KEY`, `STRIPE\_SECRET\_KEY`, `STRIPE\_WEBHOOK\_SECRET` for payment flows
- `USE\_REDIS=true` and `REDIS\_URL` to enable Redis-backed cache/channel patterns

4. Docker Installation

1. Build image from repository root

```
docker build -t aura-app .
```
2. Run container

```
docker run -d -p 8000:8000 --env-file .env aura-app
```
3. Access application at `http://localhost:8000`

5. Post-Installation Verification

- Open home page and storefront
- Log in as customer and brand owner
- Verify product pages, cart, and order views
- If configured, verify VTO request and checkout flow

6. Common Setup Issues

- ****Database connection failures****: verify `DATABASE\_URL` and DB service status
- ****Static files missing in production****: ensure static pipeline runs during deployment
- ****External integration errors****: verify API keys and webhook/network settings
